1 Purpose

The purpose of this document is to investigate the stability characteristics of the harbour tug Smit Polen. The tug was involved in an overturning incident, as consequence of a collision, but was able to recover.

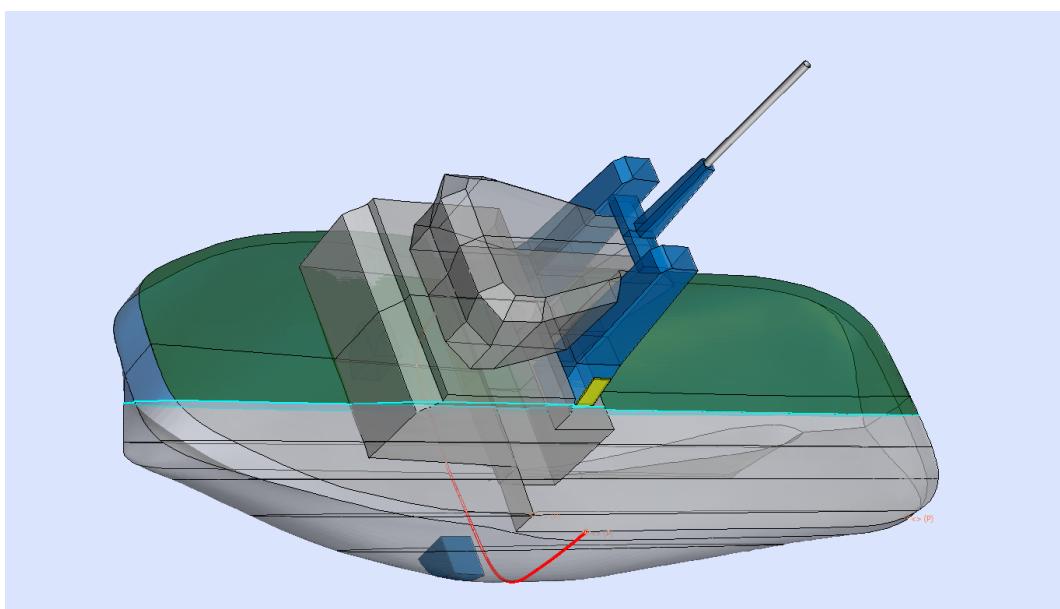

2 Summary

The loading condition during the incident was reconstructed and analysed. It is shown that the tug during the incident complied with all available requirements for a tug with non-azimuthing propellers towing over the aftship.

It is shown that the ship has a relative high arm of stability at the downflooding angle of 59°.

Smit Polen at an heeling angle of 59°.

3 Stability calculations

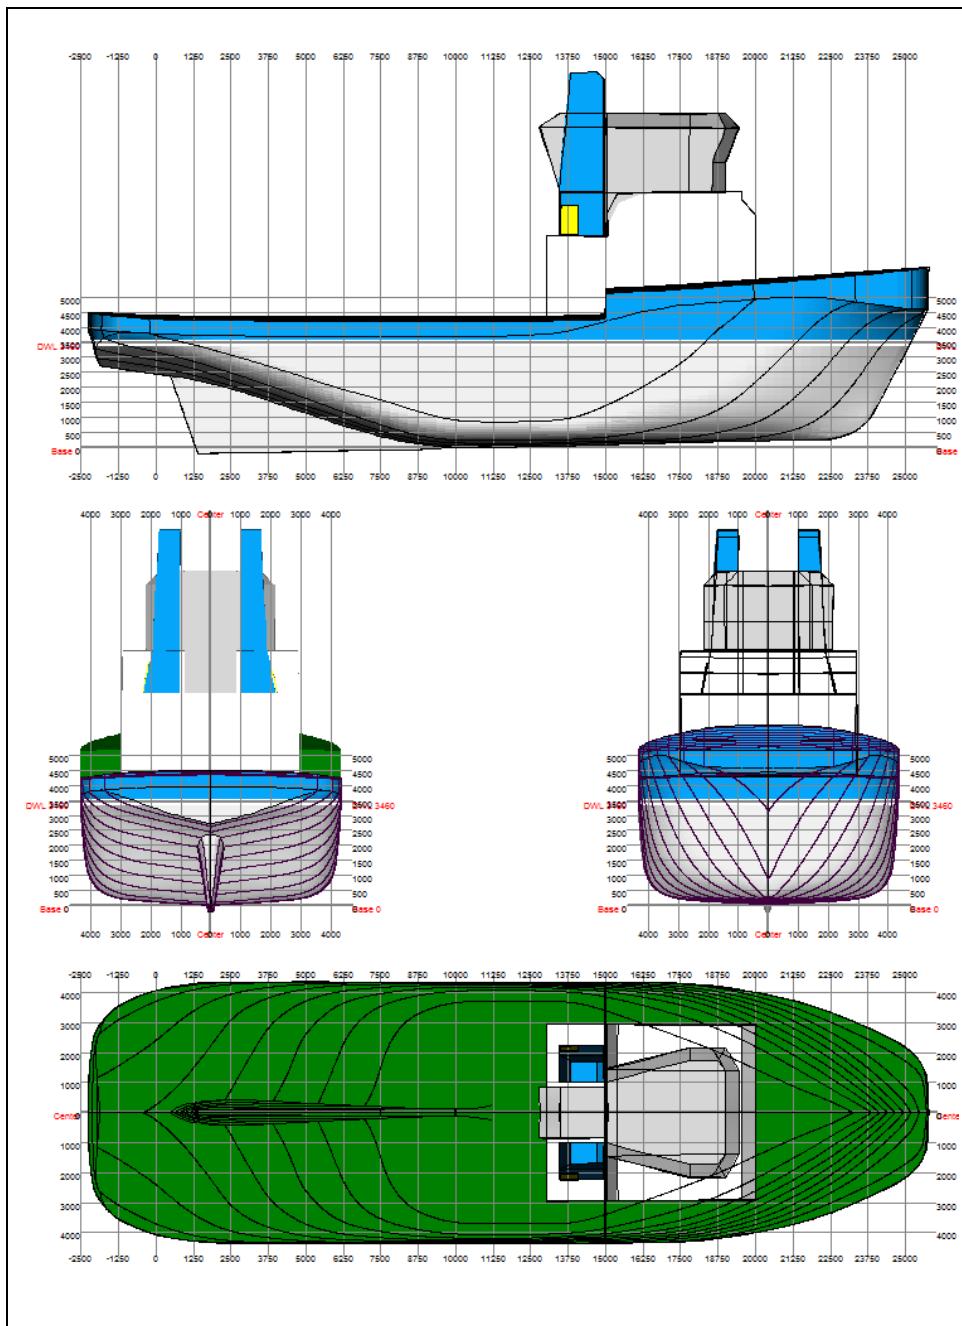

3.1 Basic information

The calculations are based on the received Linesplan, General Arrangement & Stability Booklet and the reconstruction of the loading condition received from the ship.

3.2 Linesplan

The following parts of the ship have been taken into account:

1. Hull up to main deck including skeg
2. First layer of deckhouse
3. Buoyancy of nozzles and rudders has been taken into account in the lightship weight
4. Non-Buoyancy of sea inlet chests has been taken into account in the hull form

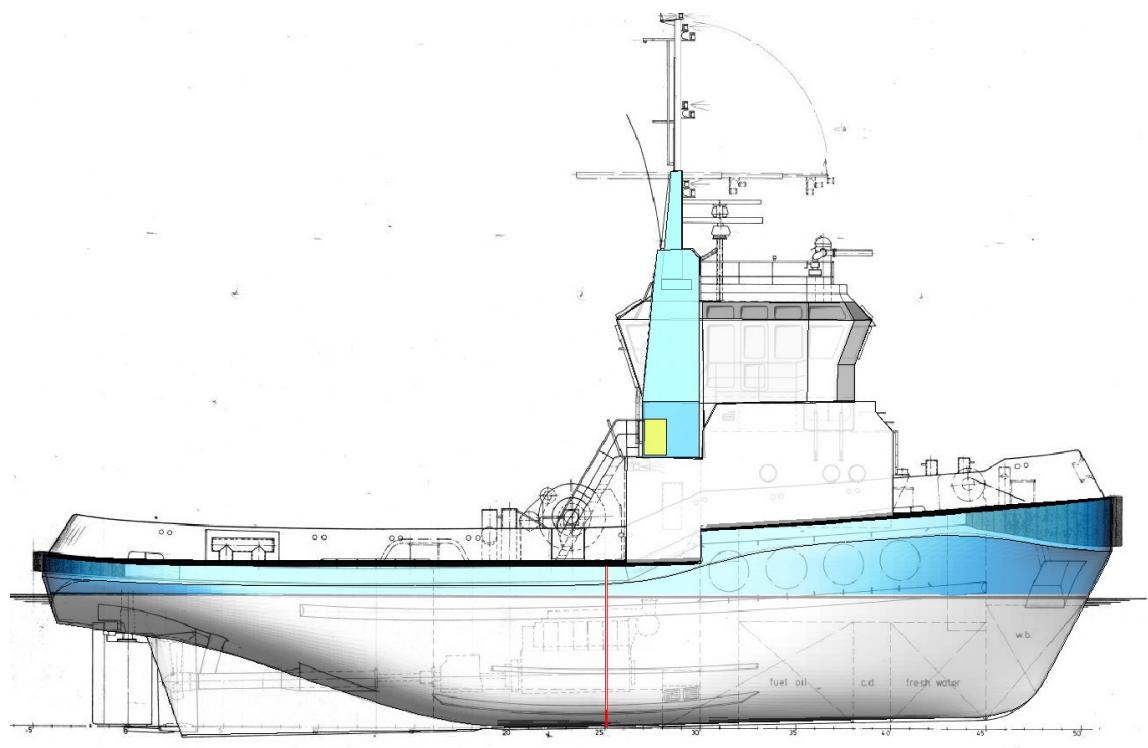

3.3 Characteristics of the lightship

The applied lightship weight is derived from the stability booklet:

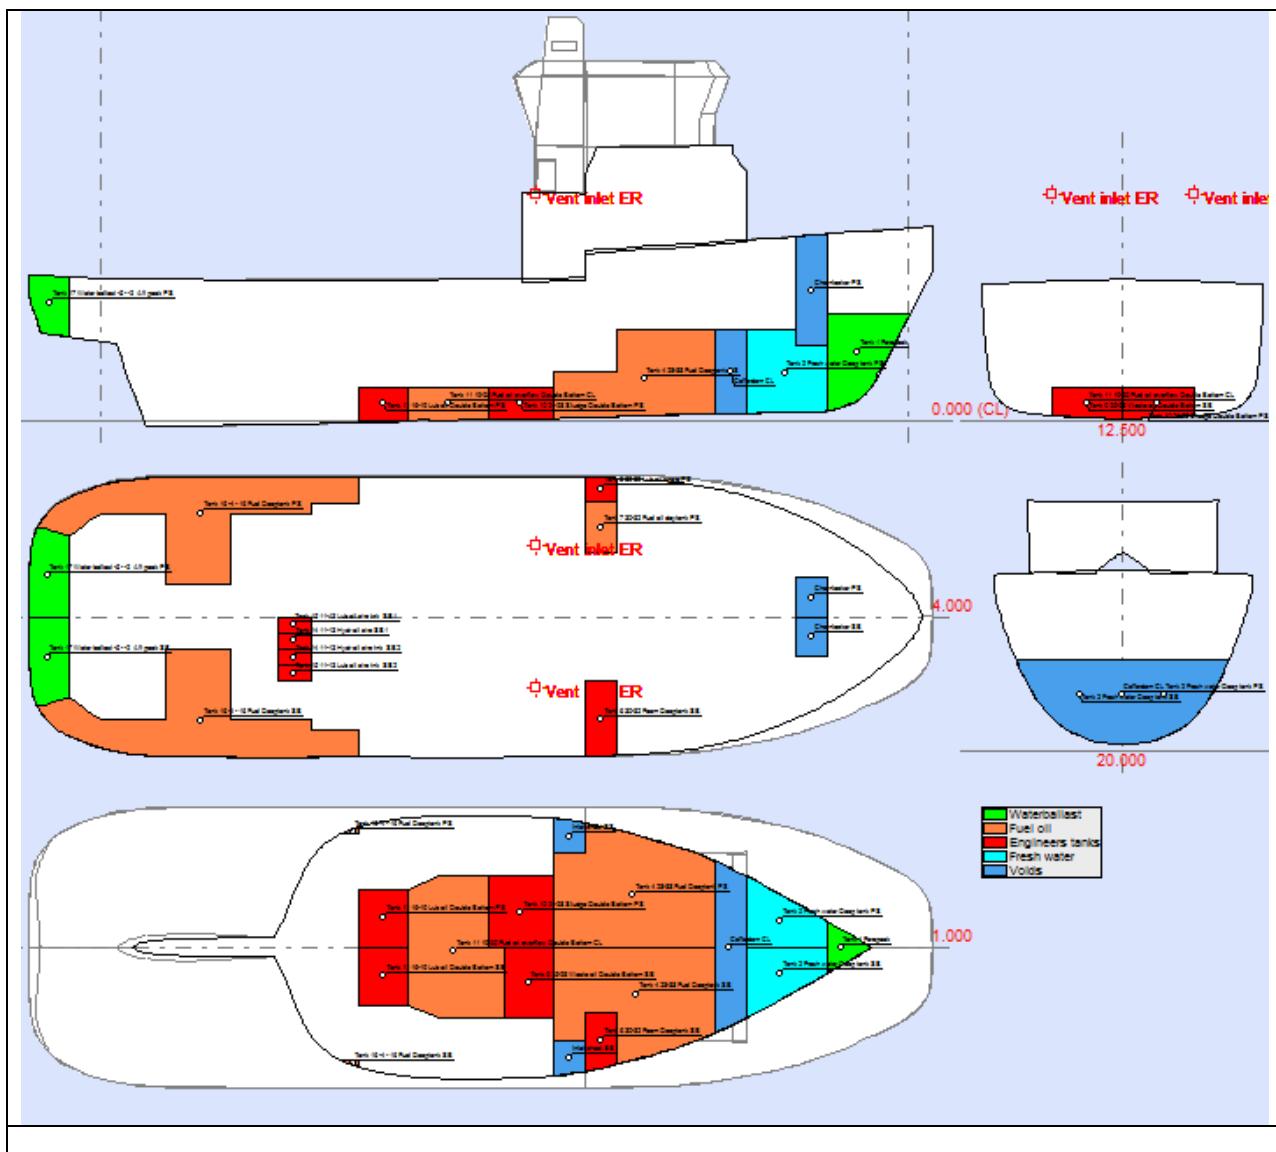

- W_{sm} = 339.34 ton
- VCG = 3.570 m
- LCG = 12.130 m
- TCG = 0.000 m

3.4 Openings taken into account

All openings of the tug were closed with exception of the air inlet to the engine room PS&SB, and indicated in the following drawing, with the following coordinates: $z / x / y = 7.00, 13.50, 2.20$ m.

3.5 Tank arrangement

4 Assumptions for loading conditions

4.1 Investigated conditions

The following loading conditions have been investigated with the stability programme *Delftship*:

- I. 100% consumables
- II. 50% consumables
- III. 10% consumables
- IV. condition during accident

The vessel including tanks is modelled in *Delftship*, and these loading conditions have been calculated, taking into account the original lightship weight and centre of gravity as mentioned in the stability booklet.

4.2 Applied heeling arms

The ship is fitted with two controllable propellers in fixed nozzles. The diameter per propeller amounts to 2150 mm and the power per propeller amounts to 882 kW. The bollard pull of the vessel is 35 tonnes.

The heeling arms for the various classification societies is based on the following data:

			Loading condition			condition incident
			100%	50%	10%	
Bollard pull		[t]	35.0	35.0	35.0	35.0
Fastening point towing line / Towing bitt above base		[m]	4.750	4.750	4.750	4.750
Centre line propeller above base			1.180	1.180	1.180	1.180

4.2.1 Heeling arm ABS

			Loading condition			condition incident
			100%	50%	10%	
ABS Tug						
Bollard pull		[t]	35.0	35.0	35.0	35.0
Reduction factor to obtain transverse towline pull		[‐]	0.500	0.500	0.500	0.500
Transverse line pull		[t]	17.5	17.5	17.5	17.5
Fastening point towing line / Towing bitt above base		[m]	4.750	4.750	4.750	4.750
Centre of effort above baseline (= 1/2 T)		[m]	1.746	1.605	1.422	1.626
Tow line heeling arm to centre of effort		[m]	3.004	3.145	3.328	3.125
Tow line heeling moment		[t m]	53	55	58	55
Heeling arm = Tow line heeling moment / Δ		[m]	0.110	0.132	0.164	0.125
Reduction function for heeling arm		[‐]	$\cos \theta$	$\cos \theta$	$\cos \theta$	$\cos \theta$
Residual dynamic stability from first intercept up to	req:		0.090	0.090	0.090	0.090
